Outline

- Introduction
- Installation
- How to run
- Input file
- Output files
- Others
- Example

Introduction – 1

What is TUMME?

- TUMME (Tsinghua University Minnesota Master Equation solver) is a computer program for setting
 up and solving one-dimensional energy-dependent master equations for gas-phase chemical kinetics.
- TUMME can solve for the phenomenological rate constants and the time evolution of energy-bin populations for a gas-phase reaction network involving single or multiple intermediate energy-wells in a (*P*, *T*) ensemble.

What can TUMME do?

- Construct the transition matrix of a master equation with discrete energy bins
- Calculate rate constants for collisional energy transfer
- Calculate microcanonical reaction rates including anharmonicity, recrossing, and tunneling
- Calculate phenomenological rate constants for a complicated reaction map
- □ Calculate the time evolution of energy populations
- Characterize the pressure and temperature dependences of chemical kinetics

Introduction – 2

- Basic assumptions of TUMME
 - Markov random process

The transition process depends on the current state and has no historical memory.

□ RRKM assumption

The intramolecular vibrational relaxation (IVR) is faster than reaction.

Bimolecular reagents equilibrated

Bimolecular pairs are always in thermal equilibrium.

- Pressure, temperature, and concentrations
 - a) Constant pressure, constant temperature
 - b) Bath gas is ideal gas
 - c) Bath gas concentration >> reactant and product concentrations

Master equation sketch

Introduction – 3

Features of TUMME

- Microcanonical flux coefficients by multistructural variational transition state theory (MS-VTST) with multidimensional tunneling (ZCT, SCT, LCT, or μ OMT)
- Inverse-Laplace transform for microcanonical rate flux coefficients
- $_{\Box}$ "Exponential-down" collision relaxation mode with energy-dependent $\langle \Delta E_{
 m d}
 angle$
- Phenomenological rate constants from chemically significant eigenmodes
- Pseudo-first order treatment when bimolecular reactions involved
- □ MPI and MP parallelism of computer code
- Double/quadruple/octuple precision for floating-point arithmetic
- □ Interfaces available for *Polyrate, MSTor,* and *Gaussian*

Installation

Installation command:

```
[user@~] tar -Jxvf TUMME2023.xz
[user@~] cd TUMME2023/
[user@~/TUMME2023] ./configure
```

- TUMME is written using Python3.
- To run basic TUMME, Anaconda should be installed.
- To use high-precision libraries, you need the configure file to compile.
- □ To use MPI, you need to install *mpi4py* module according to this webpage:

https://mpi4py.readthedocs.io/en/stable/install.html#using-pip

```
#!/bin/bash
path=`pwd`
                               INTEL does NOT work!
cd $path/C++/qd/qd-2.3.7.1
./configure --prefix $path/C++/qd CXX=g++ CC=gcc FC=gfortran
make clean
make
make install
cd $path/C++/mpack dd/src
make clean
make
cd $path/C++/mpack qd/src
make clean
make
#compile muti-preicison tumme
cd $path/C++
sed -i "s#^ROOTPATH =.*#ROOTPATH =$path#g" Makefile
make clean
make
cd $path/bin
sed -i "s#^ROOT PATH=.*#ROOT PATH=$path#g" tumme
#set enviroment variable
echo "# Enviroment variable of TUMME" >> ~/.bashrc
echo 'export PATH=$PATH:'$path'/bin' >> ~/.bashrc
```

Details in the file configure

How to run

Run command:

[user@~/TUMME2023] tumme param.in

- The script will run different commands according to the keyword #PARALLEL defined in the input file.
- □ The name of the input file can be any file name.

```
#!/bin/sh
ROOT PATH=/home/work/TUMME/
SRC_PATH=$ROOT_PATH/src
PYTHON COMMAND=python3
TUMME MAIN=tumme main.py
INPUT=$1
# read parallelism
PARALLEL_STR=$(grep "#parallel" $INPUT|tr -d '\n'|sed -e 's/[ \t]*$//g')
PARALLEL MODE=$(echo ${PARALLEL STR##* })
NPROC STR=\$(grep "#nproc" \$INPUT|tr -d '\n'|sed -e 's/[ \t]*$//g')
NPROC=$( echo ${NPROC_STR##* })
# run command
if [ "$PARALLEL MODE" == "MPI" ]
  MPI COMMAND="mpirun -np "$NPROC
else
  MPI COMMAND=' '
$MPI_COMMAND $PYTHON_COMMAND $SRC_PATH/$TUMME_MAIN $INPUT
```

Details in the file tumme

Input file – 1

- Structure of the standard input
 - Parallelism keywords
 - Parameter section
 - Reaction section
 - Species section

Structure of the standard input file "param.in"

```
#nproc 4
#parallel mpi
Parameter
    LJCollision
    End LJCollision
    Edown
    End Edown
    Temperature[K]
    End_Temperature
    Pressure[torr]
    End Pressure
    Energy
    End_Energy
    GroundSpecies
                     W1
                     0.5
    MergeThreshold
    Precision
                     double
    Prints
    End Print
End_Parameter
```

```
Reaction
    BarrierRxn
    End_BarrierRxn
    BarrierlessRxn
    End BarrierlessRxn
End_Reaction
Species
    Well
    End_Well
    TranState
    End_TranState
    Bim
    End_Bim
End_Species
```

Input file – 2

End_Species

Interface to external files

Species properties can be read from Polyrate file, Gaussian file, and Species-section, and the priority is

Polyrate file > Gaussian file > Species section

Output files

- □ *.rate
 - Temperature-and-pressure-dependent rate constants and high-pressure limits.
- □ *.out
- Properties of species and reactions and parameters while solving master equation.
- □ File printing microcanonical flux coefficients
- □ File printing partition functions
- □ File printing collisional energy transfer functions
- □ File printing time evolution of energetic-bin populations
- □ File printing CSE eigenvalues
- ☐ File printing CSE eigenvectors
 - CSE ≡ chemically significant eigenmodes

Other notes – 1

About energy

- □ Distinguish concepts of **dE**, **ESOT**, **EMAX**, and **EEOT**.
- □ Ensure ESOT > dE and EMAX > EEOT.
- ☐ The depth of an isomer well may be truncated due to the numerical method of normalization.
- ☐ If some energies of species are read from **EO** or **EELE** and others from **GO9file**, one should ensure they have consistent zeros of energy.
- At low temperatures, when molecules mainly populate low energy levels, one should decrease the value of ESOT.
- □ At high temperatures, when molecules populate high energy levels, one should increase the value of **ESOT**.

Other notes – 2

About symmetry number

Need to define Rotsigma when	Not need to define Rotsigma when			
Read properties from Polyrate	Read density of state from MSTor			
Read properties from Species section	Read properties from Gaussian			

About frequency scaling factor

Need to define Freqscale when	Not need to define Freqscale when			
Read properties from Gaussian	Read density of state from MSTor ^a			
Read properties from Species section	Read properties from <i>Polyrate</i> ^a			

^a If, as usual, the frequency scaling has been done in *MSTor* and *Polyrate*.

Example 1

1,2-H-shift isomerization of isobutyl

 $(CH_3)_2CHCH_2 \bullet \leftrightarrow (CH_3)_3CH \bullet$

This is an example for the simplest isomerization reaction. In this example, TST(RRKM) is used with the single-structure-rigid-rotor-harmonic-oscillator approximation. The rate constant and time-evolution of species concentrations are extracted from the master equation

$$\frac{\mathrm{d}\mathbf{y}}{\mathrm{d}t} = -\mathbf{W}\mathbf{y} \tag{1}$$

where y is a vector containing the population of R and P_b , and W is the transition matrix.

Input: the standard input file

Output: rate constants and the time evolution of concentrations.

Zhang, R. M.; Xu, X.; Truhlar, D. G., The Journal of Physical Chemistry A 2021, 125 (28), 6303-6313.

 $t/\mu s$

 $t/\mu s$

The time-evolution of isomers

Example 2

\blacksquare C-C and C-H β -scission of isobutylession

This is an example of competing unimolecular reactions. In this example, TST(RRKM) is used with the single-structure-rigid-rotor-harmonic-oscillator approximation. Rate constants are extracted from the master equation

$$\frac{\mathrm{d}\mathbf{y}}{\mathrm{dt}} = -\mathbf{W}\mathbf{y} + \mathbf{B}\mathbf{s} \tag{2}$$

based on CSE theory, where y is a vector containing the population of R. For the time evolution, TUMME neglect the **Bs** term of eq (2) and uses the following homogeneous master equation:

$$\frac{\mathrm{d}\mathbf{y}}{\mathrm{d}t} = -\mathbf{W}\mathbf{y} \tag{3}$$

Input: the standard input file

Output: rate constants and the time-evolution of concentrations.

Example 3

Hydrogen Abstraction from HCHO by OH (TST)

$$\text{HCHO} + \text{OH} \xrightarrow{1} \text{HCHO} \cdots \text{HO} \xrightarrow{2} \text{HCO} + \text{H}_2\text{O}$$

This is an example of a bimolecular reaction. This example uses TST(RRKM) theory with the single-structure-rigid-rotor-harmonic-oscillator is used for reaction 2, and the reaction 1 is estimated by the inverse-Laplacian transform to the hard-sphere model. Based on the CSE theory, the rate constant is extracted from

$$\frac{\mathrm{d}\mathbf{y}}{\mathrm{dt}} = -\mathbf{W}\mathbf{y} + \mathbf{B}n_{\mathrm{HCHO}}n_{\mathrm{OH}} \tag{4}$$

where the $n_{\rm HCHO}n_{\rm OH}$ is left unknown. For time-evolution calculations, the reaction is assumed to be pseudo-first order, and eq. (4) is converted to homogeneous form by appending the $n_{\rm HCHO}$ concentration to the population vector ${\bf y}$ to get vector ${\bf y}^*$,

$$\frac{\mathrm{d}\mathbf{y}^*}{\mathrm{d}t} = -\mathbf{W}^*\mathbf{y}^* \tag{5}$$

Input: the standard input file, *Polyrate* file for the reaction 2. Output: rate constants and the time-evolution of concentrations.

```

macroscopic concentration of R

The time-evolution of $n_{\rm OH}$ (solid lines) and $n_{\rm RC}$ (dash-dot lines). The initial condition is set as $n_{\rm OH}(t)$ =0=10⁻⁷ mol/L, $n_{\rm RC}(t)$ =0 and $n_{\rm HCHO}$ is assumed to be constant at 10⁻⁵ mol/L.

Example 4

Hydrogen Abstraction from HCHO by OH (MS-VTST/SCT)

This is an example of a bimolecular reaction. In this example, MS-CVT/SCT is used for reaction 2, and rate constants for reaction 1 are estimated by an inverse Laplace transform applied to the hard-sphere model. The rate constant is extracted from eq. (4) based on CSE theory, and the time evolution is estimated from eq. (5).

Input: the standard input file,

Polyrate file for reaction 2, MStor files for RC and TS

Output: rate constants and the time-evolution of concentrations.

$$\text{HCHO} + \text{OH} \xrightarrow{1} \text{HCHO} \cdots \text{HO} \xrightarrow{2} \text{HCO} + \text{H}_2\text{O}$$
